M3PM16/M4PM16 PROBLEMS 1. 13.1.2015

Q1. (i) Show that a real number x is rational iff its decimal expansion terminates or recurs.

(ii) What can be said about the decimal expansion of m/n (cancelled down to its lowest terms)?

(iii) What about binary expansions? ternary? etc.

Q2. Write

$$li(x) := \int_2^x \frac{dt}{\log t}$$

(the *logarithmic integral*, which we shall meet in Ch. III, IV in the Prime number Theorem, PNT), show that

$$li(x) \sim \frac{x}{\log x} \qquad (x \to \infty)$$

(i.e. LHS/RHS \rightarrow 1).

Q3. For $m = 1, 2, \ldots$, show that

$$li(x) - (\frac{x}{\log x} + \frac{1!x}{\log^2 x} + \dots + \frac{(m-1)!x}{\log^m x}) \sim \frac{m!x}{\log^{(m+1)}x}$$

(repeated integration by parts, or otherwise).

Q4. For p_n the *n*th prime, show that PNT

$$\pi(x) := \sum_{p \le x} 1 \sim \frac{1}{\log x}$$

gives

$$p_n \sim n \log n$$

(indeed, this is equivalent to PNT).
